

Lab 1.3.6.5 Variables: part 5

Objectives

Familiarize the student with:

- Fixing errors in a program
- Variable names
- Integer numbers
- Printing on screen

Scenario

Write a program which computes and prints the sum of the days in all four quarters of the current year. Use variables to store these four values.

If you want, you can use code from a previous task, but you will learn more if you write the code from the beginning.

Example output

```
Days in Q1 of the current year: 91
Days in Q2 of the current year: 91
Days in Q3 of the current year: 92
Days in Q4 of the current year: 92
```

Example output

```
Days in Q1 of the current year: 90
Days in Q2 of the current year: 91
Days in Q3 of the current year: 92
Days in Q4 of the current year: 92
```
